

Jasmin Field — Planning the Acquisition Programme

Group exercise worksheet — fill in as you work through the interactive tool

Two new wells are being planned in Jasmin Field. Using the companion interactive tool (exercise1_predrill_jasmin_field.html), design the acquisition programme — conveyance and tool type — for each well, then record your reasoning below.

Group / Table Number

Your asset team — assign a name to each role

Petrophysicist

Specifies which measurements/tools answer the objective

Drilling Manager

Flags what conveyance is feasible given mud and trajectory

Geologist/Geophysicist

Defines the geological objective

Exploration Manager

Weighs programme cost and risk

Step 1 — Jasmin-1 (exploration appraisal well)

Trajectory	Vertical (max 5° inclination)
Mud system	Water-based mud (WBM)
Primary objective	Structural dip & fracture ID for exploration risking
Constraint	Cost-conscious — appraisal well, not a producer

Conveyance

Image tool type

Reasoning

Jasmin Field — Planning the Acquisition Programme

Group exercise worksheet (continued)

Step 2 — Jasmin-6 (high-angle producer)

Trajectory	High-angle, 68° through the reservoir section
Mud system	Oil-based mud (OBM) — required for shale stability
Primary objective	Real-time geosteering & fracture-swarm avoidance
Constraint	Wireline unreliable above ~60-65° without tractoring

Conveyance

Image tool type

Reasoning

Step 3 — Present the programme

Summarise both wells' programmes and why they differ.
