

Jasmin Field — LWD Dip Data & the Fault Cut Decision

Group exercise worksheet — fill in as you work through the interactive tool

Jasmin-3 is drilling toward the Jasmin Sandstone objective, prognosed at 2,600 m TVD with a regional structural dip of approximately 8° toward the northeast. LWD azimuthal resistivity images and dip data are streaming to surface in real time. Using the companion interactive tool (exercise2_drilling_jasmin_field.html), work through the live dip log as a team, then record your findings and decision below.

Group / Table Number

Your asset team — assign a name to each role

Geosteerer

Real-time read of the LWD log and well pathway

Drilling Manager

Owns the steer / sidetrack / TD call

Exploration Manager

Weighs cost and risk of each option

Step 1 — Fault cut depth reading (Geosteerer's read)

Depth at which the dip pattern breaks from consistent to scattered (m TVD):

Depth (m TVD)

Step 2 — Dip characteristics above and below the fault

Above the fault

Dip magnitude (°)

Dip azimuth (direction)

Below the fault

Dip magnitude (°)

Dip azimuth (direction)

Step 3 — Team decision (Drilling Manager's call, weighed with Exploration Manager)

Select one:

Continue on plan, steer through

Sidetrack to re-target the sand

Call TD and evaluate from here

Jasmin Field — LWD Dip Data & the Fault Cut Decision

Additional notes and facilitator sign-off

What would change your recommendation?

e.g. if the throw were smaller, if the fault zone were thicker, if offset well data existed nearby

Risks and costs of your recommended option
