

Orchid Field — Depositional Model & the Offset Well

Group exercise worksheet — fill in as you work through the interactive tool

Orchid Field has four producing wells with a complete dataset: conventional core, LWD/wireline borehole images, and dip picks. Using the companion interactive tool (exercise3_postdrill_orchid_field.html), build a depositional model from the core and dip evidence, then use the structure map, facies belt, and existing well results to recommend a location for Orchid-5, the next offset well.

Group / Table Number

Your asset team — assign a name to each role

Geologist/Geophysicist

Owns the depositional model call

Petrophysicist

Assesses reservoir quality at the offset site

Exploration Manager

Weighs economic viability, presents the case

Step 1 — Depositional model (Geologist/Geophysicist's call)

Depositional environment identified (with one-line justification):

Step 2 — Offset well location (Team decision)

Structural position

Facies at proposed location

Distance from nearest existing well, and which well

Step 3 — Recommendation summary (Exploration Manager presents)

State your depositional model, where you'd place Orchid-5 and why, and how the four existing wells informed the choice.
